

ArcGIS Maps: Applying the Slice widget to a scene

This article will guide you through several steps for the Slice widget to an ArcGIS Maps scene layer. The Slice widget enables you to reveal 3D data by dragging the slide tool across the scene. This article will guide you through several steps for applying a slice widget to an ArcGIS Maps scene layer.

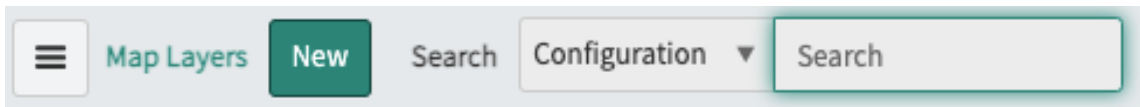

1. In the Service Now Filter Navigator enter **Map Layers** to view the ArcGIS Maps Map Layers item.

2. Click the Map Layers result item to view a list of all the map layers available in your Service Now Personal Developer Instance (PDI).

3. In the Map Layers list, search by name for the map layer (scene) you desire to configure the widget.

4. Click the desired map layer to open the map layer's configuration form.

5. Navigate the map layer's form to the Layer configuration tab.

6. In the Configuration text box, view the JSON used to construct the map layer.

JSON which stands for JavaScript Object Notation is a language-independent data format used to store and transmit data. The JSON in the Configuration text box stores the layer's configuration data required for displaying the layer in the ArcGIS Maps map.

7. Navigate the Configuration text box to where you would like to implement the widget. For this example, the code will be placed below the layer's center parameter.

8. Widgets applied to the map layer are defined in an array parameter.

Widgets array

↓

"widgets" : [

Slice

↓

{ "type": "Slice", "expand": true, "position": "top-right" },

9. When the widget JSON parameters are configured in the Configuration text box, click Update to apply the changes to the map layer.

You are now able to apply the Slice widget to an ArcGIS Maps map layer (scene).
